Microbiomes & One Health – Instructions for TP1 class (13/03/2026)

1 - Prepare for TP class 1 - Install R and RStudio

We will need R and RStudio for the TP1 class, so installing both in advance is mandatory. This will ensure that everyone is ready to follow the practical activities during the session.

Important: install **R first**, and only then install **RStudio Desktop**. R and RStudio Desktop can both be downloaded from **Posit**. RStudio requires R to already be installed.

https://posit.co/download/rstudio-desktop/

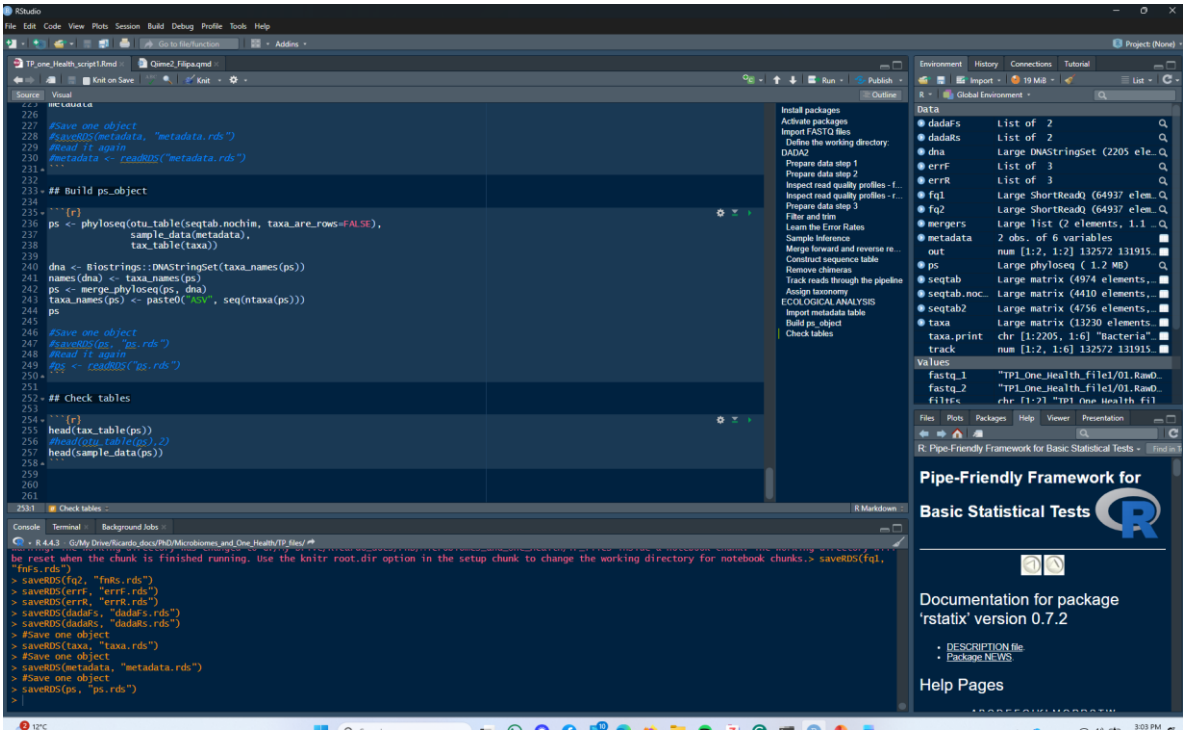

1.1 - For Windows

1. Go to the **posit.co** page and download **R for Windows**.
2. Open the installer and keep clicking **Next** using the default options.
3. When R is installed, go to the **Posit RStudio Desktop** page.
4. Download the **Windows** installer for RStudio Desktop.
5. Run the installer and finish the installation with the default options.

1.2 - For Mac

1. Go to the **posit.co** page and download **R for macOS**.
2. Choose the installer that matches your Mac and macOS version, then install it normally.
3. After R is installed, go to the **Posit RStudio Desktop** page.
4. Download the **macOS** installer for RStudio Desktop.
5. Open the downloaded file and move/install the application as requested.

Open **RStudio**.

In the Console, run:

"version"

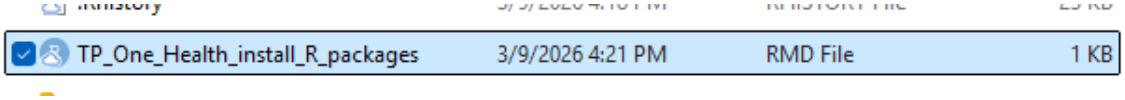

If R is correctly installed, RStudio should open and show your R version. RStudio uses the R installation detected on your computer.

The current RStudio Desktop documentation lists support for **Windows 10+** and **macOS 14+**. For older macOS versions, Posit provides a compatibility table showing which older RStudio versions matched older Mac systems.

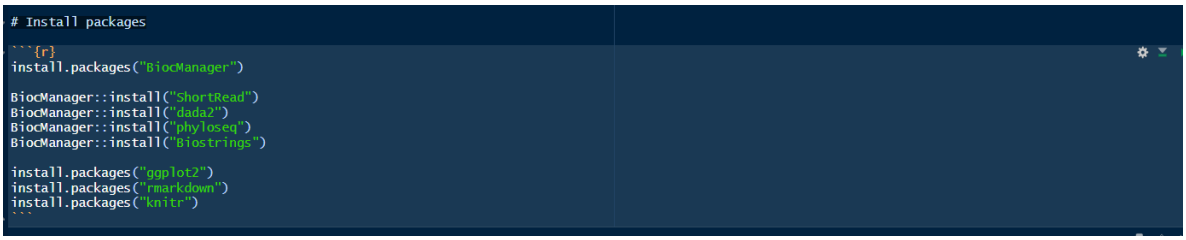

2 – Prepare R for TP class 1 – install packages

There are several R packages that we will need for the TP1 class. Installing them before the class will save time during the session.

After successfully installing R studio, open the file (click twice on the icon) called "TP_One_Health_install_R_packages.RMD"

Then, inside R studio run the code chunk called # Install packages

By pressing the green triangle on the top right  or by placing the cursor at the beginning of each code line and pressing Ctrl+Enter. All packages should be successfully installed.
